-: FUNCTION: Plays an important role in growth control. Its major role in stimulation to the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other tissues (By similarity).
-: SUBCELULAR JOCATION: Secreted.
-: SIMILARITY: BELONGS TO THE SOMAIOTROPIN/PROLACTIN FAMILY.

Brol. Evol. 18:945-95 (2001).

-!- FINCTION: Plays an important role in growth control. Its majer role in stimilate the liver and other insues to secrete IGF-1. It stimulates both the differentiation and proliferation of mychlasses, it also stimulates anno doil optake and proliferation of mychlasses, it also stimulates anno doil optake and prolifer synchesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Saimiri boliviensis boliviensis (Bolivian squirrel monkey).

"Cloning and characterisation of a putative growth hormone encoding gene from the marmoset (Callithria jacchus).";
Submitted (AUG-2000) to the EMBL/GenBark/DDBJ databases.

-!- FUNCTION: Plays an important role in growth control. Its major roie in stimulating body growth is to stimulate the liver and other tissues to secrete 1GF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other tissues (By similarity).
-:- SUBCELLULAR LOCATION: Secreted.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: Monomer, dimer, trimer, tetramer and pentamer, disulfide-
linked or non-covalently associated, in homopolymeric and
heteropolymeric combinations. Can also form a complex either with
OHRP or with the aighta2-macroglobulin complex.
SUBCELDULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE-89307277: PubMed-2744760;

Purn. Res. 51 Suppl. 1:2-6[1999)
-1- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete 10F-1. It stimulates both the differentiation and proliteration of myoblasts. It also stimulated amino acid uptake and protein synthesis in muscle and other

-:- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and protein synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2 PPTIPLSHLFDNAMLRAHRIJHQLAFDTYQEFEEAYIPKEÇKYSFLQNPQTSLSFSRSIPT

-i- FUNCTION: Plays an important role in growth control. Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete (GF-I). It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid uptake and proliferation synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selve

Flocken, J. 1991.9-24(1968).

FLONCTION: Plays an important role in growth control. Its major role in stimulation body growth is to stimulate the liver and cher ilsases. To secrete IGF-1. It stimulates both the differentiation and proliferation of myoblasts. It also stimulates amino acid upcake and proles, synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zakin M.M., Poskus E., Dellacha J.M., Paladini A.C., Samtome J.A.; "Amino acid sequences around the cystine residues in equine growth

Its major role in stimulating body growth is to stimulate the liver and other tissues to secrete 167-1. It stimulates both the differentiation and proliferation of myoblasts, it also stimulates amino acid uptake and protein synthesis in muscle and other
                                                                                                                                                                                                                                                                                                                                                           Seeburg P.H., Shine J., Martial J.A., Baxtor J.D., Goodman H.M.; "Nucleotide sequence and amplification in bacteria of structural gene for rat growth hormone.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New chimeric proteins containing buman growth hormone fragment, used particularly for the production of human insulin
                                                                                                                                           A-chains linked via amino acid chain contg. I or more glycosylation sites, for prepo. of insulic in langal delis
                                                                                                                                                                                                                          LNA sequences encoding itsulin precursors of formula H-Pg-A. where and A represent B- and A-chains of insulin respectively, and Pg represents a modified C-Peptide or any number of amino acids comprising at least one glycosylation consensus site, can be inserted into expression vectors which in turn can be used to transform fungal host cells. The fungal cells are then cultured and the insulin expressed in such cells can be harvested.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Insulin: precursor: growth hormone: chaperone: intramolecular:
                                                                                                                             DNA encoding human insulin precursors - which comprise B- and

                                                                                                                                                                                                                                                                                                                                         The inventors claim a method for the prepart of an insulin procursor in which the A-chain and 5-chain are joined through a connecting peptide. Other the A-chain at the aminotarous of A-1 to the B-chain at the carboxyl group of A-1 to the B-chain at the carboxyl group of 5-30. The method is pref. for the prepr. of human insulin precursor (see AAPA6829). The SOS of the connecting peptides of a number of species are given (see AAPA6829, AAPA6830-33).

Drecursor can be a component of chimeric proteins which additionally contains an viernihizal fragment of human growth hormone (hdis) and a cleavable peptide linker (AAVA285). The hdis portion of the chimeric protein acts as an intramclecular chaperone (1MC) for the insular protein acts as an intramclecular chaperone (1MC) for the insular protein acts as an intramclecular chaperone (1MC) for the insular chaperone (1MC) for the insular breathing it to fold correctly. The oldavable peptide linker as a C-terminal Arg residue which enables the hdr pertion of the chimeric protein to be removed after folding has taken place. Production of chaper necessary procedural steps, and hence resulting in a higher yield of wer necessary procedural steps, and hence resulting in a higher yield of the fusion protein and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyandred chape and related cyals and related concentrations and related concentrations steps of cyandred concentrations steps of cyandred not the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 FVNCHLOGSHIVEALYLVCGEKSFPYTPKTRREADHQVQQVELGGDFGANSDLFLADE 1 - 111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1111 | 1

The present invention describes an insulin-like growth factor (IGF)-1

24, 25, 43, 49 or 53, optionally in combination with an amino acid at

24, 25, 43, 49 or 53, optionally in combination with an amino acid at

position 12 and/or 16 of the native human IGF-1 sequence, is replaced

with an alanine, glycine, or a serine residue. The residue at position 7

may be rep-aced by any amino acid. (I) can have anidabatic, cardiant,

neuroprotective, anometric, tranquilliser, vubnerary, anometric,

nephrotropic, dermatological, antiHIV and antiviral activities. The IGF-1

mutants are used in any methods where IGFs or insulin are used, e.g. in

treating hypergycaemia, obesity-related, neurological, cardiac, renal,

munnological, and anabolic disorders. These disorders include lung

diseases, glomerulorephritis, interstital nephritis. Turner's syndrome,

laron's syndrome, short stature, increased fat mass-to-lean ratios,

nmunnological disorders, peripheral neuropathy, multiple sclerosis,

muscular dysturctions, kidhey disorders, ranma, wounding, lifection,

human immunodeliciency virus (HV), wounds, skin disorders, diabetes,

hart dysfunctions, kidhey disorders, and whole body growth disorders.

They can also be used for increasing serum and tissue levels of

the libratical active IGF or insulin a mammal. The IGF-1 mutants improve the

half-lives of IGF-1 and insulin. The present sequence represents the

native them a proinsulin protein sequence, which is given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               90
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   99
            Novel insulia-like growth factor (IGF) I mutants that selectively bind to IGF binding protein (IGFBP)-1 or IGFBP-3, used to improve the half-lives of IGF-I and insulia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FVNCHLOGSHLVEALYLVCGFRGFFYTPKTRREAELLQVGQVELGGGPGAGSLGPLALFG

It is used for the construction of pTrp24. The inventors claim a method for protecting bacteria from phage infection - by transformation with cloning vector cong. segment with restriction and modification activity. Prodn. of plasmid pPR 26 or pPR27 which uses pTrp24; and prodn. of plasmid pPR29 which uses a synthetic gene coding for the (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protecting bacteria from phage injection - by transformation with aloning vector confg. segment with restriction and modification

                                                                                                                                                                                                                                                                    5
                                                                                                                                                                                                                   The present invention relates to a method for reating cartifiate disorders. The method comprises contacting cartiflate with a bridger attriby such as insulin like arowth ractor (16FF) and over the A Bridger attriby preference for 16FF bridging trotten? (16FFP-8) over 16FFF in an 18F in an 18F analog with a Bridger affinity preference for 16FFF over 18FFF and 16FFF displacer peptide that prevents the interaction of 16FFF attributed to human 16FFF enceptor. The method is user, for treating cartillage disorders (CD), including degenerative CD, articular CD such as rheumatoid arthritis and esteoartheitis. The present sequence is human proinsult, which was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating cartilage disorders including cartilage damage by inyeapedegenerative cartilageness disorders, by contacting cartilage with insuliarlike growth factor analog with altered afficing for 70F-Fineing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The inventors claim new recombinant plasmids conto. a GNA sequence encoding a polypeptide, which is foreign to E.coll, in reading plass with a DNA SQ, coding for alleast one functional fragment derived from an outer membrane liporotein gene of E.coll. The foreign gene may be for human insulin. The lipoprotein gene may be the promoter, the 5'-JTR, the 3'-CTR or the transcription termination signal provided that it includes at least the promoter.
readily isolated from cell lysates and is stable on washing with urea or detergent seins, at low commus. The graphic contains it least 50% of proinsuits and all isolation operations are simplified.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents human proinsulin and was decoded from the sequences given in AAQ36996-7001. The CDNA fragment coding for proinsulin was inserted into plasmid vector pUC19 and digested with KPLI and HindIII. This resulted in the formation of the vector pPLNS. A trayment encoding amino acids 1-73 of CAT (see AAQ37002) was inserted into pPLNS to give a plasmid which contained DNA sequences which coded for amino acids 1-73 of CAT, an 8 amino acid linker sequence and human proins:iin. This plasmid, pUC-CAT-proinsulin, could be used in the formation of insulin analogues which may be used in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 FVNOHLGGSHLVEALYLVCGERGFFYTPKTRREAEDLQVGQVELGGGPGAGSLOPLALEG

This dipeptide is linked to the natural human hisulis. Section, entural human profissulin connection peptide and natural human insulis. A chain. Dipeptide removal is carefully controlled to obtain the desired prod. Without further degradation occurring, irrespective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents an analogue of native human proinsulin (hpI). The DNA encoding this sequence was used in the construction of the expression vector of the invention. The coding region of the hpI gene was synthesised and was cloned into the expression plasmid pCZRIZ6S (see also AAQ38307). Expression of this gene lead to the inclusion of an extra amino acid (Arg) in the second position from the N-terminal of mature hpI. The extra amino acid provides increased expression levels of the protein and is then cleaved off to avoid undesirable (updated on 25-MAR-200) to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proinsulis; hpI; native; pCZR126S; expression vector; E. coli; human; expression; immunological effect.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The fusion product is encoded by a synthetic sequence having at its 5'-end a medification of the 3'-end or the naturally occurring alpha-factor secretory leader and processing signal sequence, where three G.u.Aia pairs have been deleted. A plasmid containing the synthetic proinsulin coding sequence was used to transform kex2-nutain; years trans in the presence or absence of the cloned KEX2 quene. Post-translational processing of pro-insulin into peptides only occurred in yeast transformed to KEXZ plus, see also AAZ20545. (Opdated on 25-MAR-2003 to correct PA field.)
